APPLICATION

Prep well **beyond** entire dressing site according to facility protocol to ensure dressing adherence. **Allow to dry completely** (for at least 30 seconds).

Note: If the prep doesn't dry completely, the integrity and security of the dressing may be compromised. A skin protectant may be used according to preference or protocol. **Allow to dry completely.**

Apply small HubGuard cushion under catheter hub (Figure A).

Apply the bowtie shaped HubGuard over the catheter to secure (Figure B).

Remove larger dressing liner without touching adhesive (Figure C). Align notch over hub and center the insertion site in window. Adhere dressing to skin (Figure D).

Remove remaining liner. From center outward, firmly smooth down entire dressing to ensure all edges are adhered well.

Apply the v-notch tape strip over dressing and catheter tubing (Figure E).

Optional: A tape strip may be used to further secure tubing. Record information on label, remove liner and position label on the edge of the dressing.
