**APPLICATION**

Prep well **beyond** entire dressing site according to facility protocol to ensure dressing adherence. **Allow prep to dry completely.** This usually takes less than one minute.  
Note: If the prep doesn’t dry completely, the integrity and security of the dressing may be compromised. A skin protectant may be used according to preference or protocol. **Allow skin protectant to dry completely.**

Note: Liner has a label attached that can be used later to record information. Remove larger liner without touching adhesive (set aside liner). When positioning dressing, catheter hub should fall between the small and large window while the insertion site is approximately centered in the large window (Figure A). If excess catheter is exposed, smart route the catheter under window (Figure B1). Adhere dressing to skin.

Remove remaining liner, and guide tubing out through notch and overlap the edges to form a seal (Figure B and B2). Exit site edges should be touching or overlapping. From center outward, firmly smooth down entire dressing to ensure all edges are adhered well (Figure B).

Without removing the liner, slip the closure piece **under** tubing and **over** edge of dressing (Figure C). Remove the liner one side at a time and smooth down to adhere.

Record information on label, remove from liner and position label on the edge of the dressing.

**REMOVAL**

Optional: A tape strip may be used to secure catheter tubing during removal (Figure D).

Locate v-notch on outer edge of closure piece (Figure D) and pull apart in opposite directions to break center perforations (Figure E).

Holding the catheter in place, gently peel back closure piece and dressing together as one piece. Peel back slowly, keeping dressing close to the skin, following catheter toward insertion site (Figure F).

Optional: Use an alcohol prep pad underneath dressing while peeling back to help deactivate the adhesive.
